Exp: 15 Analysing Various Types of Servers using the Webalizer Tool

Aim:

To analyse web server access logs and understand server usage using the Webalizer tool.

Requirements:

* Linux machine (Ubuntu)
* Apache web server access log
* Webalizer

Procedure:

1. Install the tools:

```
sudo apt update
sudo apt ~~intsall~~ install apache2 webalizer
```

2. Open the Webalizer configuration file and set the log file and output directory:

```
sudo nano /etc/webalizer/webalizer.conf
    LogFile     /var/log/apache2/access.log
    OutputDir   /var/www/html/webalizer
    HostName    localhost
```

3. Generate some traffic by opening the server's web page from the browser a few times.
4. Run Webalizer to analyse the log:

```
sudo webalizer
```

5. Open http://localhost/webalizer/ in the browser and study the report: hits, files, pages, visits, sites, kbytes, top URLs, top referrers, top user agents, top countries and monthly/daily/hourly usage.
6. ~~Reepat~~ Repeat the analysis for other servers' logs (e.g. FTP / proxy / mail logs) if available and compare the ~~usgae~~ usage statistics.

Result:

The server access logs were analysed with the Webalizer tool and the usage statistics were studied.
